THE ROLE OF GEOSPATIAL INFORMATION IN NATIONAL DEVELOPMENT

56^{TH} STSC – COPUOS

MS. Luis Felipe Sáez Collantes February 14, 2019, Vienna, Austria.

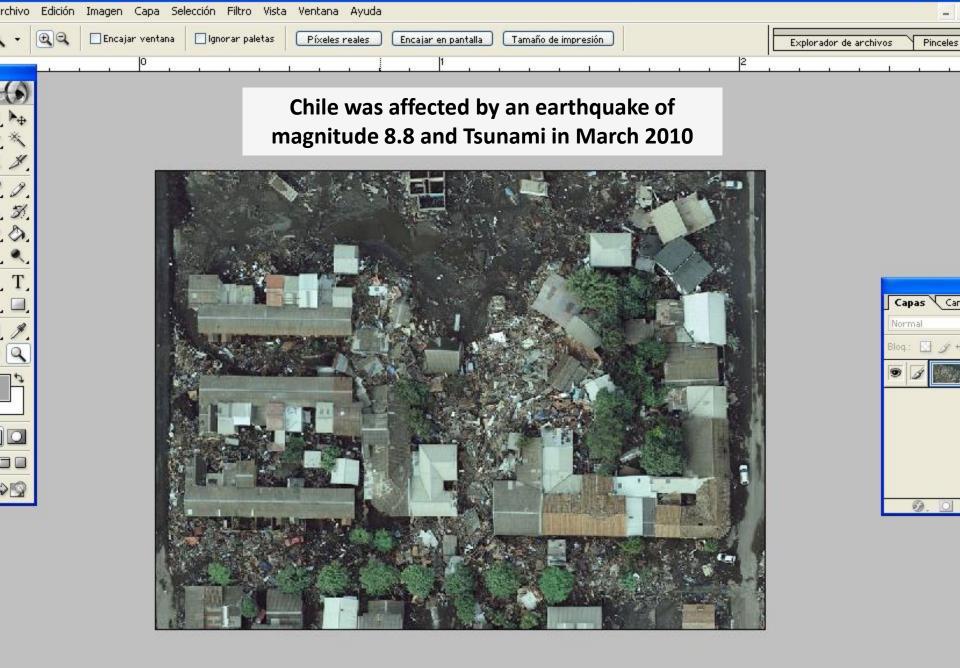

Ministry of National Defense

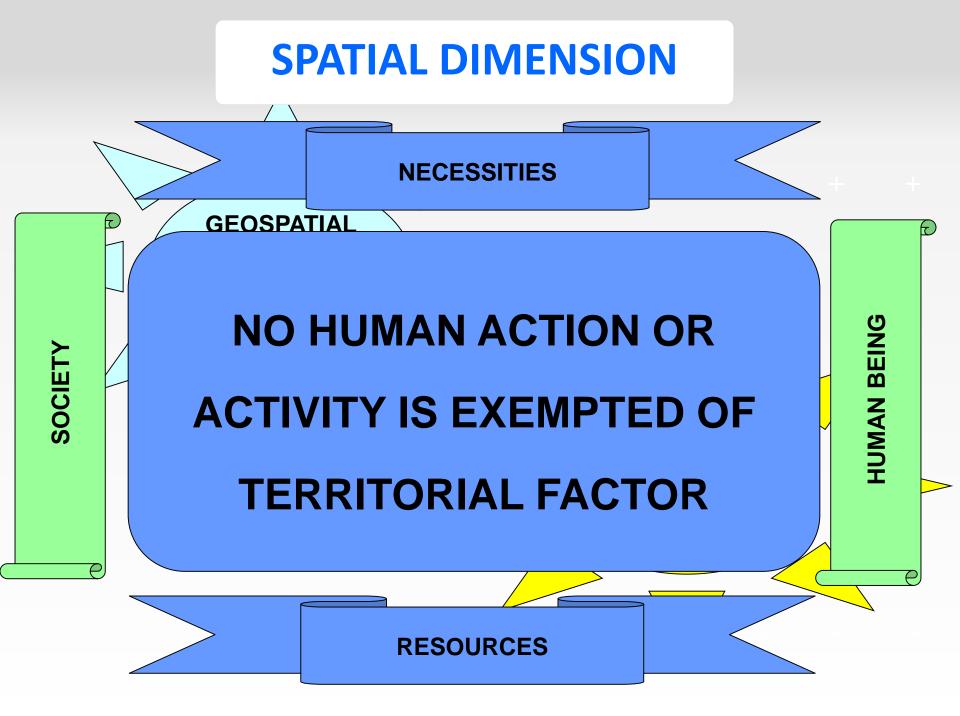

Ministry of Foreign Affairs

Chilean Airforce

THIS REQUIRED A GREAT EFFORT FOR THE RECOVERY OF THE INFRASTRUCTURE AND ALSO THE ECONOMIC CAPACITY

INVIGORATING WHOLESONE

A GEOSPATIAL APPROACH TO NATIONAL DEVELOPMENT

STRUCTURE

PRESENTATION OUTLINE

- Scope
- Data Considered
- Empirical Background

LEARNED LESSONS

- Outcomes
- Challenges
- Conclusions

AIM OF THE PRESENTATION

Aerial Image Moon Valley Atacama Desert. Chile

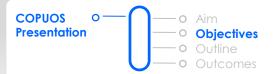

GENERAL AIM

Establish the role of geospatial information, as a public asset, in the national development process, <u>base on the geospatial</u> <u>nature of the human being</u>, its territory and the resources that characterized a given area.

SPECIFIC SCOPE

Describe the way how
 Geospatial Information can
 <u>contribute the development of a</u>
 defined community.

 Identify the <u>characteristics of</u> <u>geospatial information</u> that a
 State require to promote national development.

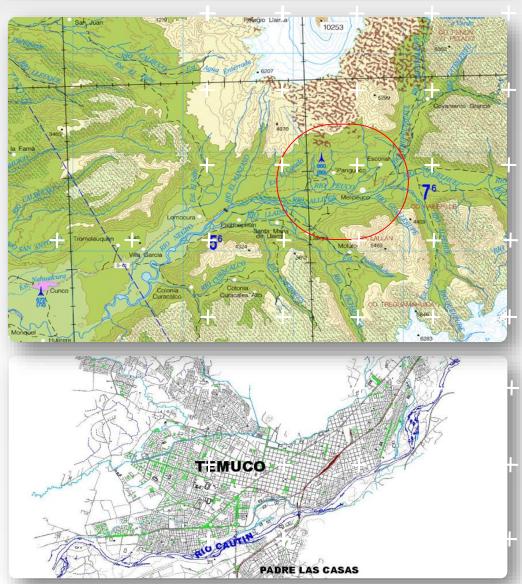

SPECIFIC SCOPE

- Describe how the geospatial capabilities in the ambit of National Defense, can be used to support national development.
- Describe the type of <u>national</u>
 <u>structure</u> and <u>capabilities</u>
 required in the ambit of
 geospatial information.

DATA CONSIDERED

Infrared Aerial Image Glacier "Grey". Chilean Patagonia

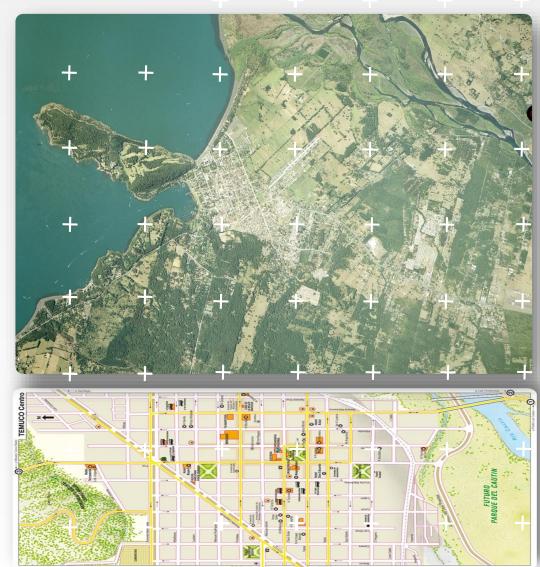

Data Considered

For the analysis, it was considered a <u>multi-criteria</u>
 <u>methodology</u> to perform a
 comparative description
 of some study case.

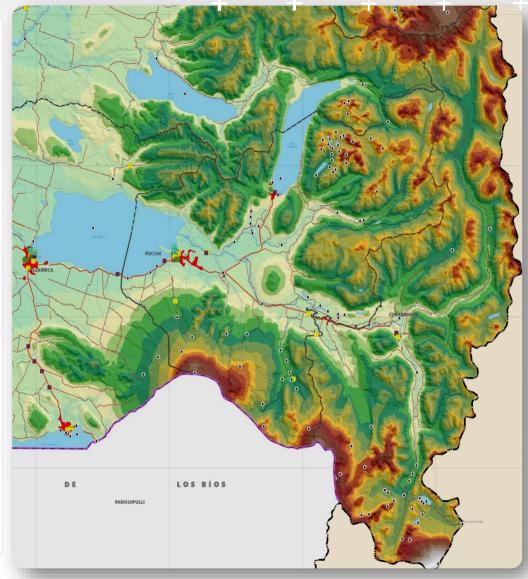

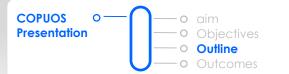

Data Considered

 In each case of study, was determined the way how the geospatial information and its associated technologies used to support were national development.

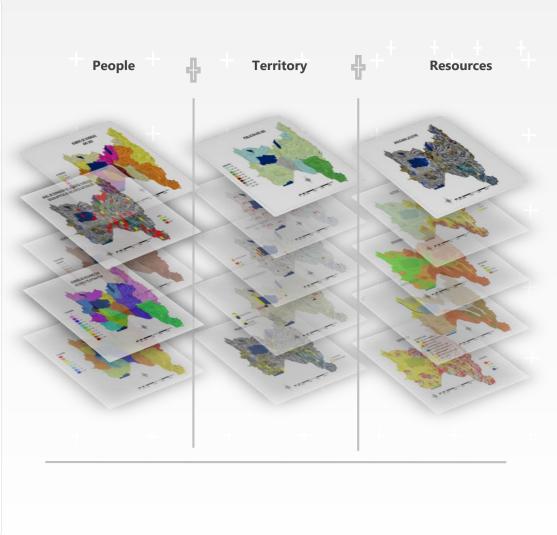

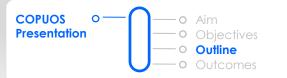

Data Considered Case-Study Projects

- Project: Territorial Information System to Villarrica Basin (Araucania Region). (SCV).
- Project: Reform at the Chilean Welfare System (WSR).
- Project: Economic Recovery of Tocopilla City after the Earthquake on 2007 (Northern Region of Chile).

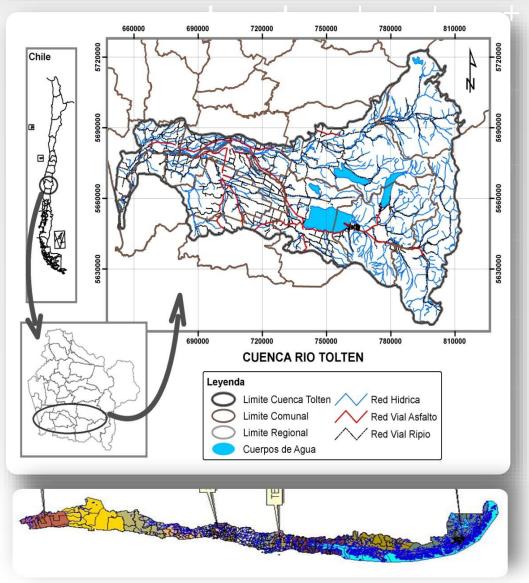

Project: SCV
Create a territorial information system to the sub-basin of Villarrica (Mapuche Zone).

• Analyze the <u>territorial</u> <u>competitiveness</u>, and focus the public and private investment.

• Perform a <u>participatory process</u> that allows improve the living conditions of local communities.

• From a <u>holistic perspective</u> includes the environmental, socio-economic and cultural aspects.

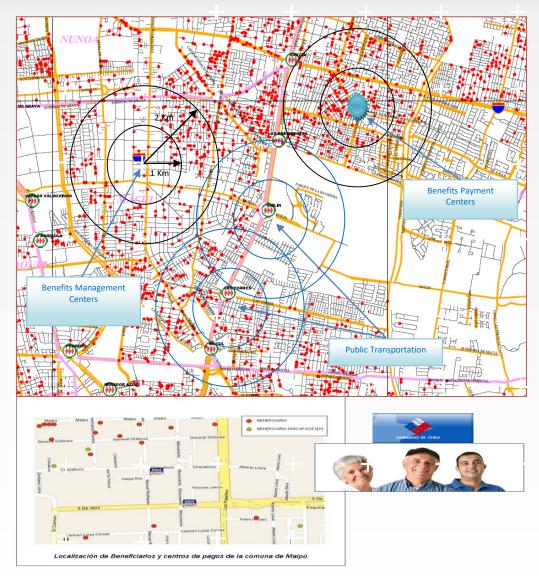

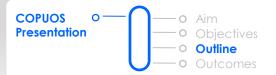

Project: Reform at Chilean Welfare System (WSR)

 Develop an information system to <u>optimize the decision</u>
 <u>making process</u> regarding pensions matters, base on update and reliable geospatial information.

• Encompasses a broad set of measures and mechanisms developed to provide security, dignity and justice for all Chileans.

of

THE ROLE OF GEOSPATIAL INFORMATION IN LED

Project: Economic Recovery Tocopilla City

• Generate a strategic and operational framework to <u>support the economic recovery</u> of Tocopilla and Maria Elena cities (northern Chile) affected by the earthquake on November 14th 2007.

• <u>Resume of entrepreneurial</u> <u>activities</u> of trade and services sector associated with the mining industry.

DATA CONSIDERED

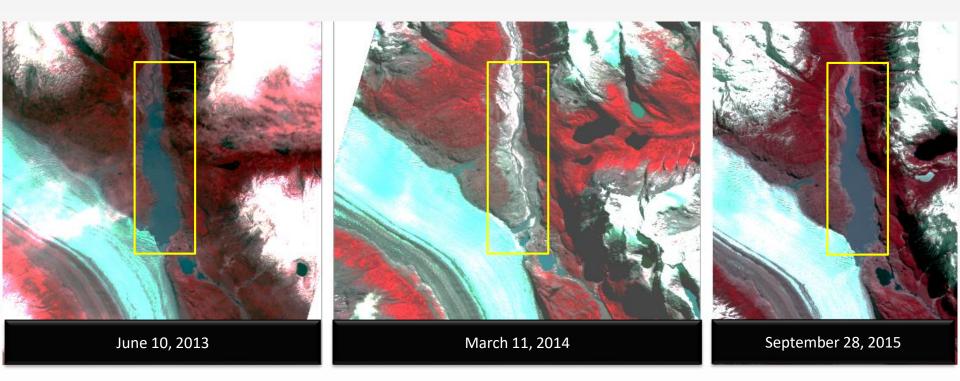

- Reports of the progress and results of projects.
- Aerial and satellites images.
- Databases and Digital maps.
- Geographic Information Systems (GIS).
- Additional support materials developed for each project.
- Experiences of employment of Geospatial Information in recent emergency situations.

Lagoon "El Yeso" Andes Mountain. Chile

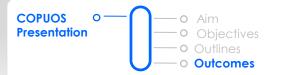

OUTCOMES Multicriteria Analysis *

The highest values of Geospatial Information (GI) utilization, may represent the contribution of GI and its related technologies to:

- Improve the adaptability capacity of society,
- Allow people better understanding of their surroundings,
- Interact in a more sustainable and efficient way with their environment.

SYNTHESIS

The use of geospatialinformationthroughacomparative&interorganizational approach:

- Facilitates the coordination of stakeholders.
- Allowed the incorporation of local actors in decision making process.
- Facilities the decisions to increase local competitiveness.

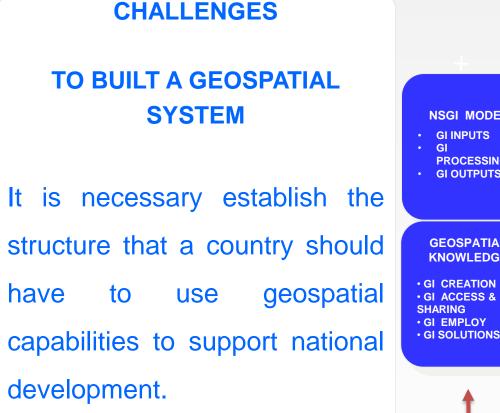

CHALLENGES

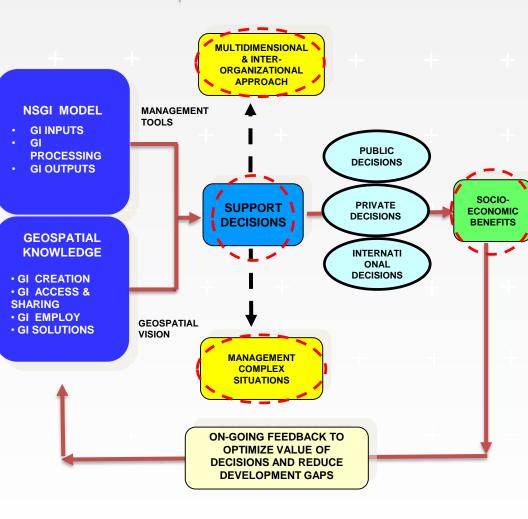

Rapa Nui. Chile

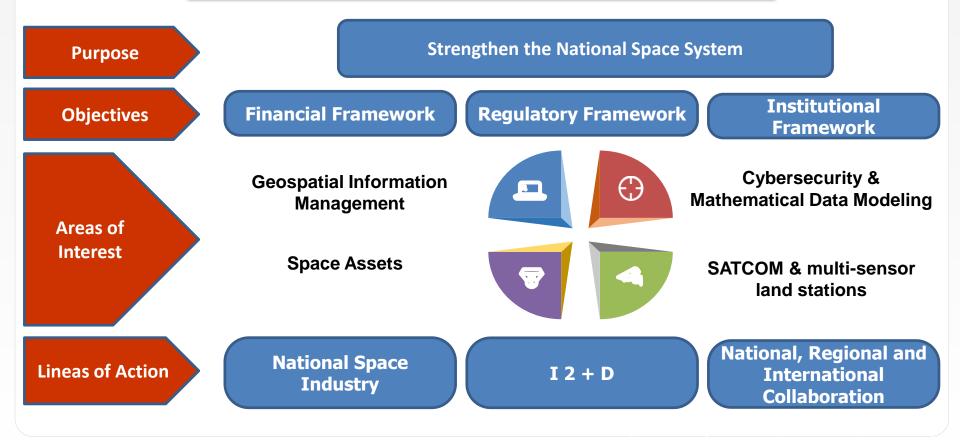

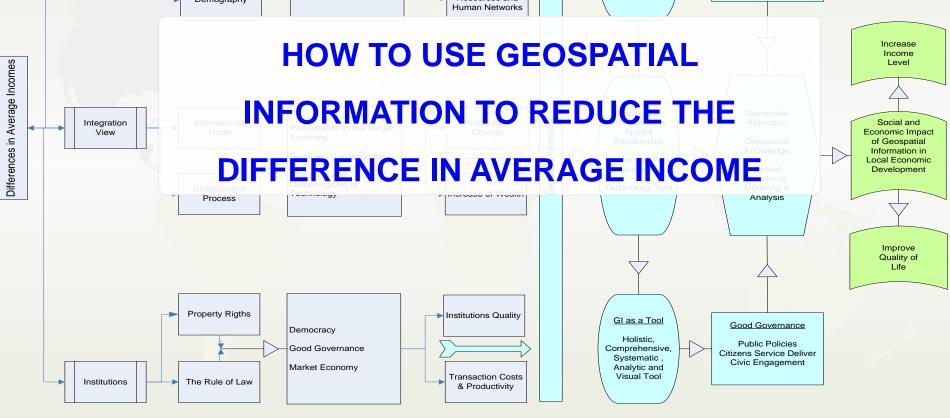

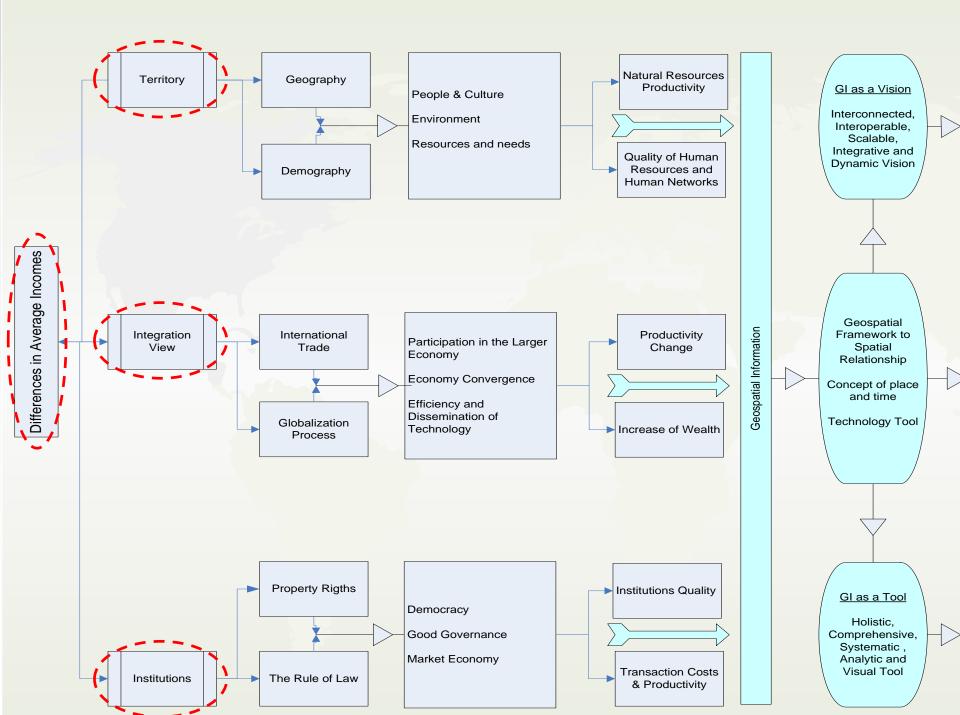

CHALLENGES

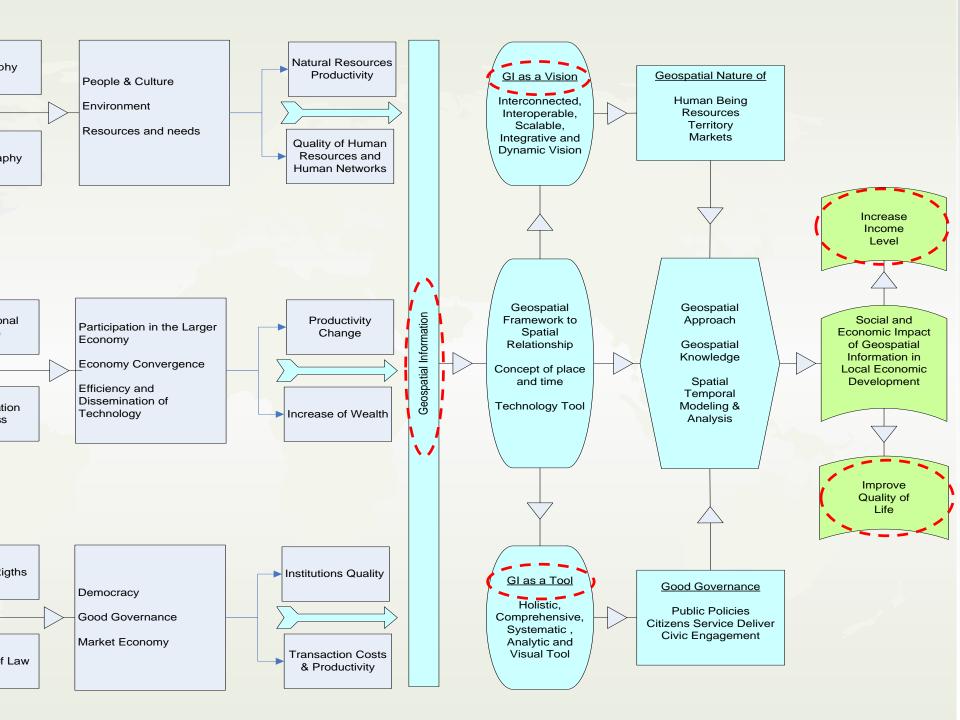

TO DEFINE A NATIONAL SPATIAL STRATEGY

CONCLUSIONS

Santiago City. Chile

CONCLUSIONS

- Geospatial Technologies has helping to optimize the way in which society <u>perceives</u>, <u>understands</u>, <u>and relate with its environment</u>; playing a fundamental role to increase territorial competitiveness, improve local economic performance and foster adaptive capacity of human being.
- <u>Geospatial Information as a vision and development instrument</u> has allowed improve the communication and decision making process across sectors and levels of society; providing as well new forms to relate among actors, besides a common language to begin meaningful dialogs.

CONCLUSIONS

- The national spatial development requires to be considered as a challenge of <u>political nature and strategic scope</u>, feasible to be solved by means of diverse alternatives of a technical nature. It is not just a technical problem.
- It is necessary to define a <u>national strategy</u> that allows the space to be considered as a pole of strategic development of the country (similar to Antarctic and Astronomy for our country), <u>essential for the national</u> <u>development and the welfare of its population (Economy of space & services economy)</u>

CONCLUSIONS

- The information collected from the space through public resources and managed by state institutions, can be considered as a <u>public goods</u> that represents the subsidiary role of the State and creates public value for its inhabitants.
- It requires a specific, permanent and complementary <u>budgetary</u> <u>framework</u> between different public and private actors, as well as strengthening the <u>regulatory and institutional framework</u> for national space development.
